DIGITALOCEAN KUBERNETES

Kubernetes in minutes

Managed Kubernetes designed for you and your small business. Start small at just \$10 per month, and scale up and save with our free master node and inexpensive bandwidth.

Simple, Managed Kubernetes

- ✓ Free master node
- ✓ Release faster
- ✓ Scale automatically
- ✓ Increase availability
- ✓ Application portability

COMMUNITY CURRICULUM

Kubernetes for Full-Stack Developers

0 of 25 steps complete

Summary View Detailed View

By Topic

- Containers
- Application Development
- Monitoring
- Operations
- CI/CD

[Table of Contents](#)

Whether you're just curious, getting started with Kubernetes, or have experience with it, this curriculum will help you learn more about Kubernetes and running containerized applications. You'll learn about core Kubernetes concepts and use them to deploy and scale applications in practical tutorials. By the end of this curriculum you'll be able to create your own Kubernetes cluster from scratch and run your own applications on it. You will also learn how to set up monitoring, alerting, and automation for your applications on Kubernetes.

Goals:

1. Develop with a distributed architecture in mind.
2. Deploy successfully

Approach:

Ensure understanding of:

Where secrets are located

What's in the application/server base images

How to troubleshoot Concourse

How to kick off and roll back deployments

Developers on Community

Goals:

1. Develop with a distributed architecture in mind.
2. Deploy successfully

Approach:

Ensure understanding of:

Where secrets are located

What's in the application base image

How to troubleshoot Concourse

How to kick off and roll back deployments

What does it mean to deploy in a distributed environment at the application level?

Developers on Community

Goals:

1. Develop with a distributed architecture in mind.
2. Deploy successfully

Approach:

Key Takeaways:

Make time for meta-level discussions

Lay theoretical foundations before operational

Effective Kubernetes onboarding:

Kubernetes Documentation

We will use these files to create different types of objects: Services, which will ensure that the Pods running our containers remain accessible; Deployments, which will contain information about the desired state of our Pods; a PersistentVolumeClaim to provision storage for our database data; a ConfigMap for environment variables injected at runtime; and a Secret for our application's database user and password. Some of these definitions will be in the files kompose will create for us, and others we will need to create ourselves.
