LAYERS

Why use a Service Mesh?

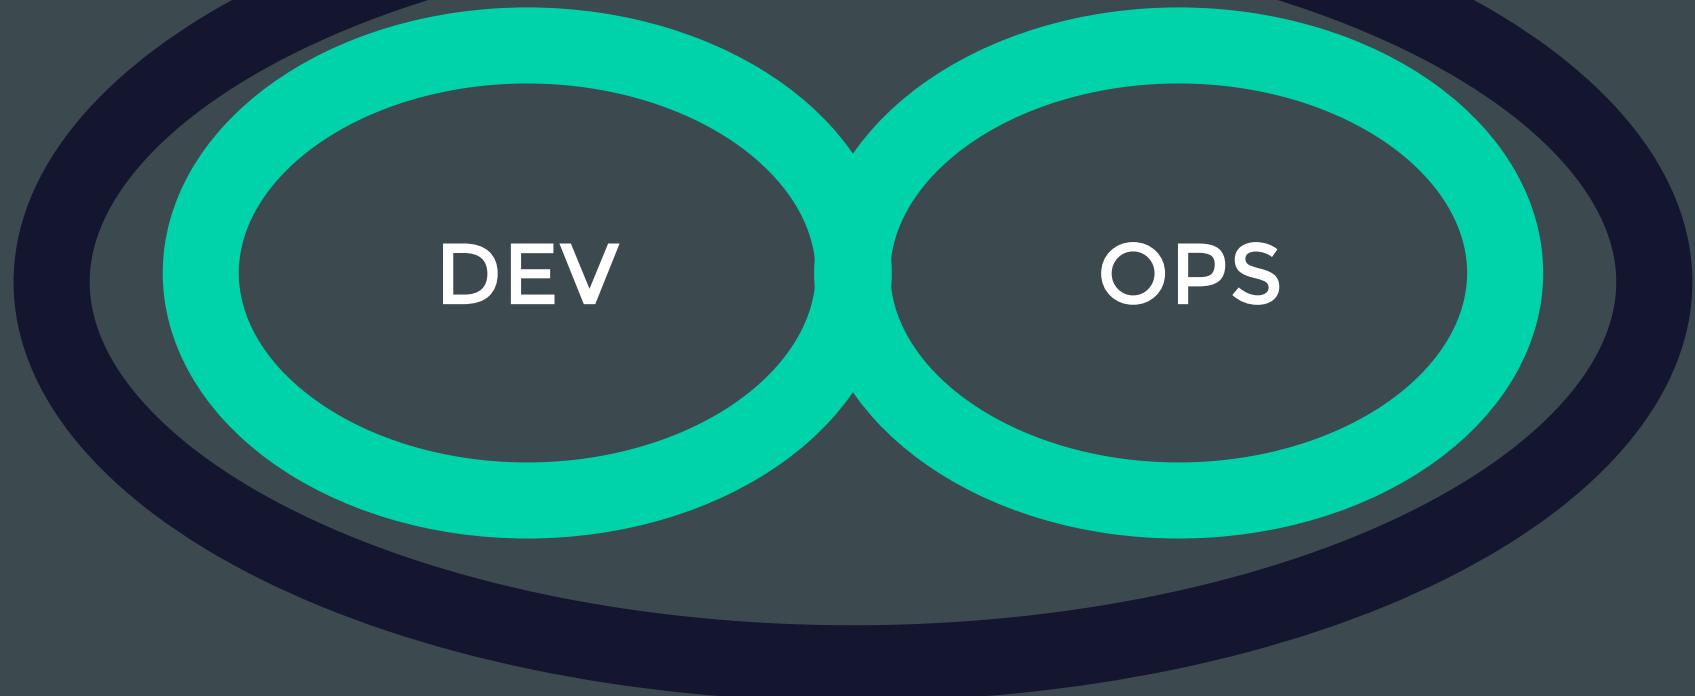

to avoid...

- Bloated service (application) code
- Duplicating work to make services production-ready
 - Load balancing, auto scaling, rate limiting, traffic routing...
- Inconsistency across services
 - Retry, tls, failover, deadlines, cancellation, etc., for each language, framework
 - Siloed implementations lead to fragmented, non-uniform policy application and difficult debugging
- Diffusing responsibility of service management

LAYER5

Service Mesh Architectures

Service Mesh Architecture

Management Plane

- Provides multi-mesh federation, backend system integration, expanded policy and governance, continuous delivery integration, workflow, chaos engineering, configuration and performance management.

Control Plane

- Provides policy, configuration, and platform integration.
- Takes a set of isolated stateless sidecar proxies and turns them into a service mesh.
- Does not touch any packets/requests in the data path.

Data Plane

- Touches every packet/request in the system.
- Responsible for service discovery, health checking, routing, load balancing, authentication, authorization, and observability.

Ingress Gateway

Egress Gateway

You need a management plane.

LAYERS

layer5.io/landscape

It's meshy out there.

Service mesh abstractions

to the rescue

Service Mesh Interface (SMI)

A standard **interface** for service meshes on Kubernetes.

Multi-Vendor Service Mesh Interoperation (Hamlet)

A set of API standards for enabling service mesh **federation**.

Meshery is interoperable with these abstractions.

LAYERS

Service mesh abstractions

to the rescue

Service Mesh Interface (SMI)

A standard **interface** for service meshes on Kubernetes.

Service Mesh Performance Specification (SMPS)

A format for describing and capturing service mesh **performance**.

Multi-Vendor Service Mesh Interoperation (Hamlet)

A set of API standards for enabling service mesh **federation**.

Meshery is interoperable with these abstractions.

LAYERS

Service Mesh Performance Specification

*vendor neutral service mesh
performance measurement standard*

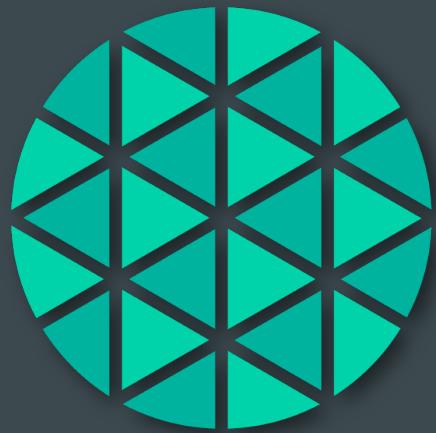

SIG Network: Service Mesh WG

Directly provides:

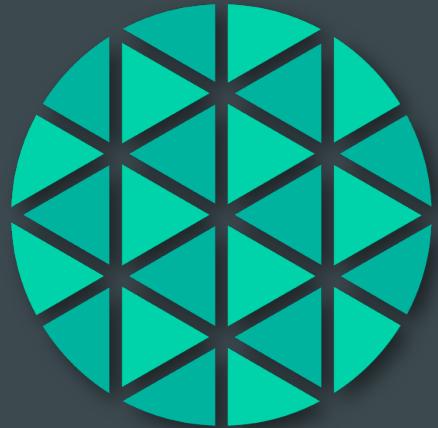

- A vendor neutral specification for capturing details of infrastructure capacity, service mesh configuration, and workload metadata.

Facilitates:

- a universal performance index to gauge a service mesh's efficiency against deployments in other organizations' environments.
- apples-to-apples performance comparisons of service mesh deployments.

Assess your service mesh configuration against deployment and operational best practices with Meshery's configuration validator.

The screenshot shows the Meshery web interface. On the left, there's a sidebar with icons for Consul, Istio, Linkerd, Network Services, Octarine, and Citrix, along with a Community section. The main area has tabs for 'Cluster' (selected), 'Namespace' (set to 'default'), and 'Service'. A central modal window displays a warning: '▲ Missing prefix in service - consul-consul-server'. It states: 'The service consul-consul-server in namespace default contains the following port name(s) not prefixed with mesh supported protocols: serflan-tcp, serfwan-tcp, server, dns-tcp. Consider updating the service port name with one of the mesh recognized prefixes.' Below the modal are buttons for 'Dismiss' and 'Close'. To the right of the modal is a 'Notifications' sidebar with several items: 'User pod count' (green), 'Multiple service association - consul-consul-server' (red), 'Vetter: DanglingRouteDestinationHost ran' (green), 'ServiceHost ran' (green), 'Vetter: MeshVersion ran successfully' (green), 'mTLS and liveness probe incompatible - consul-consul-connect-injector-webhook-deployment-c8b8896lql2r7' (red), and 'Vetter: AppLabel ran successfully' (green). At the bottom of the interface are buttons for 'Validate Service Mesh' and 'Apply Custom Configuration'.

Meshery analyzes your service mesh and workload configuration

LAYER5

PERFORMANCE

Mb/s

An optimization game

with many variables

Data plane performance depends on many factors, for example:

- Number of client connections
- Target request rate
- Request size and Response size
- Number of proxy worker threads
- Protocol
- CPU cores
- Number and types of proxy filters

Latency, throughput, and the proxies' CPU and memory consumption affected by these factors

LAYERS

What is WebAssembly?

for the web, malware and beyond

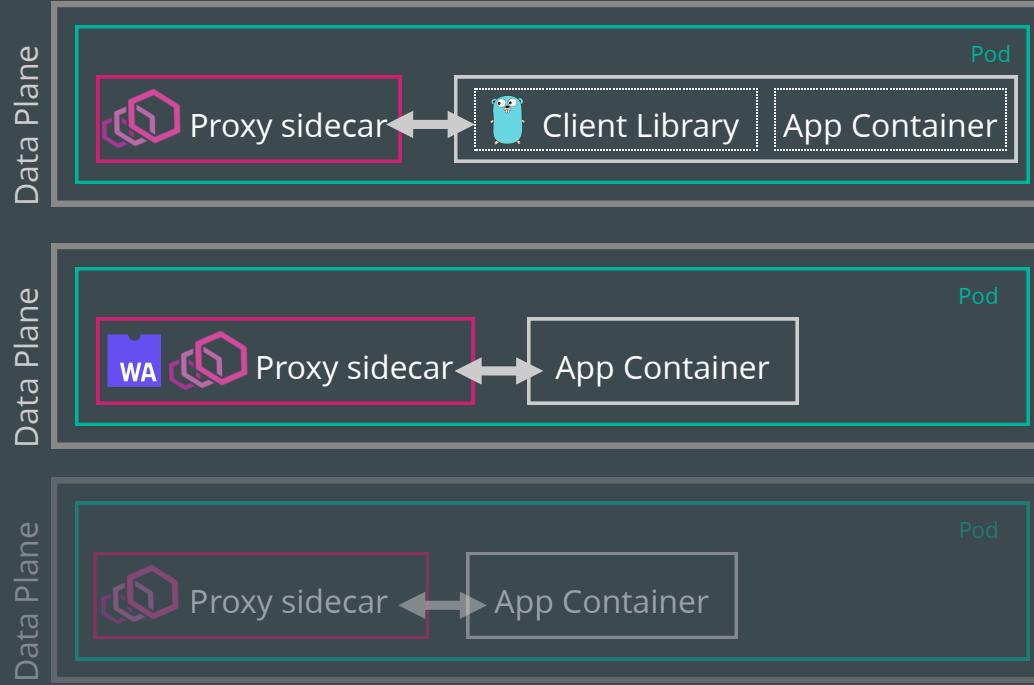

WA

- A small, fast binary format that promises near-native performance for web applications.
- Most modern browsers support it.
- Safe and sandboxed execution environment.
- Over 40 languages that support WASM as a compilation target.
- Originally used to speed up large web-applications.

Round robin
load balancing

Context-based routing

Understanding the trade-off between power and speed

LAYER5

Optimizing your average response time

In the presence of Bucket 1...

...take your largest segment by count and divide by your number of cores

Performance Testing Best Practices

Use Meshery's powerful performance management features

- easily reproduce tests
- persist test results
- use different load generators
- baseline and compare over time
- test your workloads on and off the mesh
- tweak configurations and try again
- compare 6 different service meshes and counting...
